TV-C201 TV-C141

COLOR TELEVISION

- TYPE: KER (C141/C201)
KER3 (C201)

SPECIFICATIONS

Category

Color television

Broadcasting color system

BG, DK

Television color system

PAL, SECAM, NTSC^{4.43}, NTSC^{3.58}

Receivable channel

BAND	CHANNEL
VHF-L	R1 - R5, E2 - E4
VHF-H	R6 - R12, E5 - E12
UHF	E21 - 69

Aerial Input

75 ohms, unbalanced

Picture Tube

TV-C141: 14"

TV-C201: 20"

Screen size

TV-C141: 280(W) × 335(D) × 211(H)mm
(11¹/₈ × 13¹/₄ × 8³/₈ in.)

TV-C201: 404(W) × 480(D) × 303(H)mm
(16 × 19 × 12 in.)

Video Input/Output

1 Vp-p, 75 ohms

Audio Input

0.5 Vrms., 33 k ohms more

Audio Output

0.5 Vrms., 2.2 k ohms less

Speaker

TV-C141: 76 mm (3 in.) round

TV-C201: 126 × 76 mm (5 × 3 in.) oval

Operating Voltage

110 - 240 V AC, 50/60 Hz

Power Consumption

TV-C141: 70W

TV-C201: 85W

Earphone jack

Monaural-mini jack

Operating temperature

5°C - 40°C

Operating humidity

35% - 80%

Dimensions

TV-C141: 410(W) × 367(D) × 330(H)mm
(16¹/₄ × 14¹/₂ × 13 in.)

TV-C201: 570(W) × 460(D) × 437(H)mm
(22¹/₂ × 18¹/₈ × 17¹/₄ in.)

Weight

TV-C141: 9.5 kg (19.8 lbs.)

TV-C201: 18 kg (39.6 lbs.)

- Design and specifications are subject to change without notice.

SERVICE MANUAL

NOTICES BEFORE REPAIRING

To make the best use of this equipment, make sure to obey the following items when repairing (or mending).

1. Do not damage or melt the tunicate of the leading wire on the AC1 side, including the power supply code.
2. Do not soil or stain the letters on the spec. inscription plates, notice labels, fuse labels, etc.
3. When repairing the part extracted from the conducted side of the board pattern, fix it firmly with applying bond to the pattern and the part.
4. Restore the following items after repairing.
 - 1) Conditions of soldering of the wires (especially, the distance on the AC1 side).
 - 2) Conditions of wiring, bundling of wires, etc.
 - 3) Types of the wires
 - 4) Attachment conditions of all types of the insulation.

Fig-1

When servicing and checking on the TV side, note the followings.

1. Keep the notices

As for the places which need special attentions, they are indicated with the labels or seals on the cabinet, chassis and parts. Make sure to keep the indications and notices in the operation manual.
2. Avoid an electric shock.

There is a high voltage part inside. Avoid an electric shock while the electric current is flowing.
3. Use the designated parts

The parts in this equipment have the specific characters of incombustibility and withstand voltage for safety. Therefore, the part which is replaced should be used the part which has the same character. Especially as to the important parts for safety which is indicated in the circuit diagram or the table of parts as a Δ mark, the designated parts must be used.
4. Put parts and wires in the original position after assembling or wiring.

There are parts which use the insulation material such as a tube or tape for safety, or which are assembled so that these parts do not contact with the printed board. The inside wiring is designed not to get closer to the

5. After repairing, always measure the insulation resistance and perform the voltage-withstand test (See Fig-1).

- 1) The insulation resistance must be 1.2 to 2.5 MΩ when applying 500 V per second.
- 2) In the voltage-withstand test, apply 1.2 KV for two seconds and check that the GO lamp lights.

* Breaking current set to 10 mA.

- * Connect the safety checker as shown in Fig-1, then measure the resistance and perform the test.
- * Do not touch the equipment during testing.
- * For details of the safety checker, refer to the supplied operation manual.

6. General notices when repairing mechanism

- 1) Dirt on the head causes deterioration of the picture quality, distortion of sound and the irregular rotation. Make sure to clean the "Head, Rotating", "Head, CTL", "Head, Erasing", "Roller, Pinch" and "Capstan" with alcohol.
- 2) Note that if oil or grease sticks to the rotating part (the surfaces of the rubber and transporting tape) such as the belt, capstan, roller, pinch, etc. it will cause slipping or abnormal function.
- 3) When removing "Ring, E", "Washer, Slider", etc which attach parts, replace them with new ones. Do not use them again.
- 4) Make sure to use the regular parts for repairing this equipment. And do not use the parts that cannot be used as the common using part, or the remodeled parts, because these parts cause abnormal functions of mechanism and damage.

- pyrogenic parts and high voltage parts. Therefore, put these parts in the original positions.
5. Take care of the cathode-ray tube.

By setting an explosion-proof cathode-ray tube is set in this equipment, safety is secured against Implosion. However, when removing it or serving from backward, it is dangerous to give a shock. Take enough care to deal with it.
 6. Avoid an X-ray.

Safety is secured against an X-ray by considering about the cathode-ray tube and the high voltage peripheral circuit, etc. Therefore, when repairing the high voltage peripheral circuit, use the designated parts and do not change the circuit. Repairing except indicates causes rising of high voltage, and the cathode-ray tube emits an X-ray.
 7. Perform a safety check after servicing.

Confirm that the screws, parts and wiring which were removed in order to service are put in the original positions, or whether there are the portions which are deteriorated around the places serviced.

DISASSEMBLY INSTRUCTIONS

1. HIGH-VOLTAGE CAP (ANODE CAP) REMOVAL

1-1. Cautions before Removing

Discharge the anode voltage

- (1) The anode voltage is not discharged completely from the CRT of this unit even after the power is turned off. Be sure to discharge the residual anode voltage before removing the anode cap.

Do not use pliers

- (2) Do not use pliers, etc. to remove the anode cap. If you used pliers and bent the hook to remove the cap, the spring characteristics of the hook could be lost, and when reinstalled, the cap would come off from the CRT anode button easily, causing an accident.

Do not turn the anode cap

- (3) If the anode cap is turned in the direction of its circumference, the hook is likely to come off.

1-2. Anode Cap Removal

Discharge the anode voltage. (See Figure 1)

- (1) Connect a flat-bladed screwdriver to the CRT GND via an alligator clip.
- (2) Use a tester to check the end of the screwdriver and ground of the TV for continuity.
- (3) Touch the hook with the end of the screwdriver.

Caution : Be careful not to damage the anode cap.
- (4) Turn over the anode cap. (See Figure 2)

Caution : Be Careful not to damage the anode cap.
- (5) Push the anode cap with your thumb in the direction of arrow ① as shown in the figure, then lift the cap in the direction of arrow ② to release the hook on one side. (See Figure 3)
- (6) Turn over the anode cap on the side where the hook was released and pull out the cap in the direction opposite to that in which the cap was pushed. (See Figure 4)

Caution : Do not pull out the anode cap straight up.
: Do not pull the cap forcibly. After removing the cap, check that the hook is not deformed.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

2. ANODE CAP REINSTALLATION

Observe the cautions carefully so that no accident occurs due to a defect in installing the anode cap and so it does not come off.

2-1. Cautions before Reinstalling

Never turn the anode cap after installing it

Never re-use the hook when it has been deformed

- (1) If the anode cap is turned after it is installed, it may come off. Therefore, arrange the high-voltage cable before attaching the anode cap. (See Figure 1)
- (2) If you have attached the anode cap before arranging the high-voltage cable, arrange the cable carefully so the cap does not turn.

Fig. 1

2-2. Anode cap reinstallation

- (1) Use a clean cloth moistened slightly with alcohol to clean the installation section. (See Figure 2)
- Caution: Check that the installation section is free from dust, foreign matter, etc.
- (2) Coat the anode cap installation circumference with an appropriate amount of the specified silicone grease (KS-650N). (See Figure 2)

Caution: Be careful of silicone grease.

- (4) Turn over the rubber cap symmetrically on the left and right. (See Figure 4)

Caution: Turn over the rubber cap symmetrically on the left and right.

: Take great care not to damage the anode cap.

Fig. 4

- (5) Fit your forefinger over the projection at the center of the cap and hold the cap between your thumb and middle finger. (See Figure 5-1)

- (6) Apply the hook on one side to the anode button as shown in the figure. (See Figure 5-2)

Caution: Check that the hook is held securely.

- (7) Apply the hook on the other side to the anode button as shown in Figure 5-3.

Fig. 5-1

Fig. 5-3

Fig. 5-2

- (8) Pull the anode cap slightly with the rubber cap turned over and visually check that the hook is engaged securely.

- (9) Release your hand from the rubber cap of the anode cap.

Caution: Cover the anode cap so that it does not lift.

- (10) Hold the skirt of the anode cap slightly to improve the close contact between the cap and CRT.

- (11) Check that the anode cap is in close contact with the CRT. (See Figure 6)

Fig. 6

3. CASE REMOVAL

3-1. Rear Cabinet Removal (See Figure 1)

- (1) Remove four screws ① and three screws ②, then remove the rear cabinet in the direction of the arrow.

Fig. 1

3-2. Neck C. B. (PWB, NK) Removal (See Figure 2)

- (1) Disconnect CN553 (CRT GND).
(2) Remove the Neck C.B. in the direction of arrow ①.

3-3. Main C. B. (PWB, MAIN) Removal (See Figure 2)

- (1) Disconnect the GND wire from the speaker grille (arrow ②).
(2) Remove speakers (L, R) in the direction of arrows ③.
(3) Pull out the Main C. B. in the direction of arrow ④.

Fig. 2

ADJUSTMENT

NK Circuit Board (Solder Side)

SETUP FOR ADJUSTMENT

Since the video signal generated by a pattern generator is used for adjustment, this video output signal should be within the specifications. Observe the output waveform with a $75\ \Omega$ load and check that the amplitudes of the sync signal, video component and burst signal are approx. 0.3V, 0.7 V and 0.3 V and they are flat, and also the ratio in level between the burst signal and red signal is 0.30 : 0.66. If these drift, the pattern generator must be calibrated (refer to the instruction manual of the pattern generator). Use a LEADER LCG404 pattern generator.

CAUTIONS DURING ADJUSTMENT

Be sure to satisfy the following conditions before adjusting any items.

- Warm up the unit for more than 20 minutes (do not switch it off midway).
- Set all the customer picture controls to their center positions when otherwise not specified.
- Set the output level of the pattern generator to 1.0 Vp-p (with a $75\ \Omega$ load).

1. CRT ADJUSTMENT

Caution:

1. Warm up the unit for more than 20 minutes.
2. Turn the power of the unit on and use a degaussing coil to degauss the whole screen.

1-1. Center Convergence Coarse Adjustment (See Figure 1-1)

- (1) Loosen the screw holding the deflection coil.
- (2) Receive a green raster signal from the pattern generator.
- (3) Move the deflection coil until it touches the funnel

of the CRT.

- (4) Adjust two purity magnets so that green appears at the center of the screen and red and blue appear at the two edges.
- (5) Switch the pattern generator from the green raster signal to a crosshatch signal.
- (6) Loosen the ring holding the rotary magnet.
- (7) Adjust two 4-pole magnets so that red and blue of the red, green and blue crosshatch patterns at the center of the screen overlap each other.
- (8) Adjust two 6-pole magnets so that red/blue (magenta) and green overlap each other.
- (9) Repeat steps (7) and (8) so the screen becomes white.

Fig. 1-1

1-2. Purity Adjustment

Caution :

Perform this adjustment after completing adjustment 1-1.

- (1) Receive a green raster signal from the pattern generator.
- (2) Adjust the two purity magnets by opening them at the same angle so the center of the screen becomes green. Also adjust them so the widths of the color at both edges are equal.
- (3) Tighten the rotary magnet retaining ring.
- (4) Move the deflecting coil gradually backwards (towards the neck) and stop it when the whole screen becomes green.
- (5) Perform the same check for monochromatic red and blue.
- (6) Observe the picture and correct the tilt of the deflecting coil and tighten the deflecting coil retaining screw. If color unevenness remains at the circumference of the screen, use a landing magnet to correct it. (See Figure 1-2)

Fig. 1-2

1-3. Center Convergence Adjustment

Caution :

Perform this adjustment after completing adjustment 1-2.

- (1) Receive a crosshatch signal from the pattern generator.
- (2) Adjust two 4-pole magnets so that red and blue of

the red, green and blue crosshatch patterns at the center of the screen overlap each other.

- (3) Adjust two 6-pole magnets so that red/blue (magenta) and green overlap each other.

1-4. Circumference Convergence Adjustment

Caution :

Perform this adjustment after completing adjustment 1-3.

- (1) Move the deflecting coil up/down and to the left/right to adjust the drift at the circumference of the screen. (See Figure 1-3)
- (2) Insert three wedges between the deflecting coil and CRT funnel surface to retain the deflecting coil.

Fig. 1-3

Fig. 1-4

2. ELECTRICAL ADJUSTMENT

2-1. Screen Adjustment

- (1) Use the service switch (SW301) to set the TV to the service mode (single horizontal line).
- (2) Set the TV to the external input mode (no input).
- (3) Connect an oscilloscope to TP553 (on the NK C.B.).
- (4) Adjust SFR 552 (G-CUT OFF) so the voltage at TP553 is 150V DC. (See Figure 2-1)
- (5) Disconnect the oscilloscope.
- (6) Adjust the SCREEN VR (FBT) so that a horizontal line begins to appear at the center of the screen.
- (7) Return the service switch (SW301) to its original position.

Fig. 2-1

* Be sure to perform the sub-brightness adjustment after completing this adjustment.

2-2. White Balance Adjustment (NK C.B.)

- (1) Receive a PAL raster signal (white).
- (2) Set the customer picture controls "brightness" and "contrast" to minimum.
- (3) Set the CUT OFF SFR (SFR551, SFR552, SFR553) and DRIVE SFR (SFR554, SFR555) to their mechanical centers.
- (4) Leave the CUT OFF SFR of the color which is brightest on the screen as it is and use other two CUT OFF SFR to adjust the white balance.
- (5) Set the customer picture controls "brightness" and "contrast" to maximum.
- (6) Turn SFR554 (R DRIVE) fully counterclockwise so the whole screen becomes red.
- (7) Turn SFR554 (R DRIVE) gradually clockwise and stop it where red disappears from the screen.
- (8) Turn SFR555 (B DRIVE) fully counterclockwise so the whole screen becomes blue.
- (9) Turn SFR555 (B DRIVE) gradually clockwise and stop it where blue disappears from the screen.
- (10) Repeat steps (1)-(4) and (5)-(9) until the white balance has been adjusted completely.
- (11) Return the customer picture controls to their original positions.
- (12) Receive a stairstep signal (color bar with chroma off) and check that there is no unnatural color at

any bands.

* Perform 2-3. Sub-brightness adjustment after completing the white balance adjustment.

2-3. Sub-brightness Adjustment

- (1) Receive a PAL stairstep signal (color bar with chroma off).
- (2) Adjust SFR2 so the band next to the right end starts to light. (See Figure 2-2)

Two bands on the right are dark and cannot be distinguished.

The band on the right end is not lit and the adjacent band is very dim.

The band on the right end is lit.

Fig. 2-2

2-4. Focus Adjustment

- (1) Receive a PAL dot pattern signal.
- (2) Adjust the FOCUS SFR (FBT) so the focus of the dots is optimum.

2-5. Center Position Adjustment

- (1) Receive a PAL center cross signal.
- (2) Adjust SFR302 so the condition shown in Figure 2-3 is obtained.

Fig. 2-3

2-6. Vertical Size Adjustment

- (1) Receive a PAL crosshatch signal.
- (2) Adjust SFR501 so the aspect ratio (ratio of horizontal vs vertical) is 3:4.

Fig. 2-4

2-7. Sub-tint Adjustment

- (1) Receive an NTSC 4.43 MHz color bar signal.
- (2) Connect an oscilloscope to TP47B.
- (3) Adjust SFR1 so the bottom edges of the waveform fall on one line. (See Figure 2-5)

Fig. 2-5

2-8. OSD Position Adjustment

- (1) Receive a color bar signal.
- (2) Press the select switch once.
- (3) Adjust L1 so the OSD characters are displayed as shown in Figure 2-6.

Fig. 2-6

2-9. AGC Adjustment

- (1) Receive a PAL color signal under the following conditions.
Input level: 62 dB μ
Modulation percentage: 87.5%
Received channel: CCIR CH E9 or E12
- (2) Adjust SFR201 so the voltage at TP15 is 7.0 V \pm 0.3 VDC.

3. TUNER ADJUSTMENT

3-1. PAL DELAY Adjustment

- (1) Receive a PAL DEM pattern signal.
- (2) Connect an oscilloscope to TP46R.
- (3) Adjust SFR301 and L303 several times alternately so the A and B components are minimum. (See Figure 3-1)

Fig. 3-1

3-2. SECAM Reference Coil Adjustment

- (1) Receive a SECAM color bar signal.
- (2) Connect a DC voltmeter to TP61.
- (3) Adjust FL304 so the DC voltage is maximum (more than 10 V).

3-3. SECAM Detector Coil Adjustment

- (1) Receive a SECAM color bar signal.
- (2) Connect an oscilloscope to TP46R.
- (3) R-Y adjustment
Adjust FL302 so the amplitude from black to white in periods ④ and ⑤ is the same as that of the sync signal as shown in Figure 3-2.

Fig. 3-2

- (4) Connect the oscilloscope to TP46B.

(5) B-Y adjustment

Adjust FL301 so the amplitude from black to white in periods ④ and ⑤ is the same as that of the sync signal as shown in Figure 3-3.

Fig. 3-3

3-4. 4.43 MHz Trap Adjustment

- (1) Receive a PAL color bar signal.
- (2) Connect an oscilloscope to IC301 pin 58.
- (3) Adjust TC301 to minimize 4.43 MHz chroma components. (See Figure 3-4)

Fig. 3-4

3-5. Bell Filter Adjustment

- (1) Receive a SECAM magenta signal.
- (2) Connect an oscilloscope to IC301 pin 18.
- (3) Adjust FL303 so the amplitudes of the two waveforms on the left and right are equal. (See Figure 3-5)

Fig. 3-5

3-6. Video Detector Coil Adjustment

Use the following test equipment.

- Swemar Generator LSW-1481
- VIF Plug-In Unit 480-U80
- Alignment Scope LB0-9C
- ATT/Signal Selector LAS-1575-42

- (1) Connect the test equipment as follows. (See Figure 3-6)

Fig. 3-6

- (2) Apply 3.5 VDC to TP14.
- (3) Adjust L205 so the 38.0 MHz marker is the lowest waveform at TP12. (See Figure 3-7)

Fig. 3-7

3-7. AFT Coil Adjustment

- (1) Coarse Adjustment

Connect the sweep SG, etc. in the same way as in 3-6. Video Detector Coil Adjustment. Apply a signal to TP11 and turn AFT off.

ATT: 20 dB

- (2) Adjust L204 so the 38.0 MHz marker is at the center of the straight line of the waveform at TP16.

Fig. 3-8

- (3) Precise Adjustment

Use an AM/FM SSG.

- CARRIER 38 MHz
- LEVEL 90 dB μ

Apply a signal to TP11 and turn AFT off.

- (4) Adjust L204 so the DC voltmeter reads $2.5V \pm 0.2V$ at IC1 pin 16.

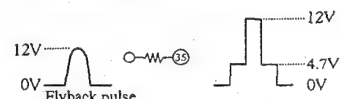

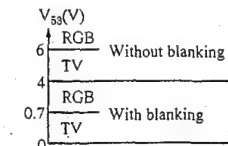

IC, DESCRIPTION

IC, TMP47C837N – U411 (Z)

Pin No.	Pin Name	I/O	Description
1	VT	O	Tuner tuning voltage output (PWM output)
2-6	CONTRAST, BRIGHT, COLOR, TINT, SHARPNESS	O	Picture control voltage outputs (PWM outputs)
7	VOL	O	Volume control voltage output (PWM output)
8	MUTE	O	Audio muting voltage output (both speaker and line input)
9	TONE	O	Monaural sound (expander) control voltage output
10	DI/O	I/O	E ² PROM data input/output
11	CS	I/O	E ² PROM CS output/key matrix KO1
12	CLK	I/O	E ² PROM CLK output/key matrix KO2
13-15	KO 0-2	I	Key matrix KIO-2
16	AFT	I	Tuner AFT voltage input
17	SYS 1	O	Tone switch (bass boost) voltage output (PWM output)
18	SYS 2	I/O	On-timer LED control output/key matrix KO4
19	SYS 3	O	AFT control voltage output
20	SO 1	O	Sound multiplex forced mono mode switching voltage output
21	GND	—	GND
22	SO 2	O	Sound multiplex output switching voltage output
23, 24	GREEN, RED	O	OSD control signal outputs
25	Y(BL)	O	Luminance signal output (background blanking control signal output)
26, 27	HD, VD	I	OSD horizontal/vertical sync pulse inputs
28, 29	OSC 1, OSC 2	I/O	OSD oscillator
30	TEST	I	Microprocessor shipment test terminal (normally, GND)
31, 32	XTAL IN, OUT	I/O	Microprocessor operation clock oscillator
33	RST	I	Microprocessor reset input
34	KEO	I	Key matrix KI3
35	RMC	I	Remote control receiver pulse input
36	SD	I	Tuner SD (sync detection) input
37	TV/V	O	TV (tuner)/V (VCR) switching voltage output
38	POWER	O	Secondary power control output
39	AFT DET	I	Matrix surround control output
40, 41	BN2, BN1	O	Tuner band switching output
42	VD	—	Power supply

IC,TA8759BN

Pin No.	Pin Name	I/O	Description
1, 3	SR DEEMP	—	For the connection of a SECAM deemphasis filter
2, 64	R-Y/B-Y OUT	O	Color difference signal outputs
4, 5, 8, 9	SB, SR DET	—	For the connection of a SECAM detection tank coil
6	VCC	—	VCC=12V (standard). Power supply of chroma circuits
7	COLOR	I	Color control terminal. Goes "L" when the color killer operates.
10, 11, 21	SW1, 2, 3	I/O	Outputs an identification signal in the auto mode and receives a forced signal in the manual mode. See the logic table for the outputs in the auto mode. When current over 0.75 mA (standard) flows to pin 11, an NTSC signal is not accepted. When current over 0.75 mA (standard) flows to pin 21, a killer is applied to the color-difference outputs and the RGB system is set to the color state. When pin 21 is set to "H" in the manual mode so the above switch is not turned on, set it to 6.0V+/-0.5V. (Do not connect to a power supply.)
12	DL IN	I	PAL/SECAM chroma 1H delayed signal input
13	DC	—	DC bias of PAL/NTSC matrix circuit and SECAM permutator
14	DL OUT	O	1H delay line PAL/SECAM chroma output
15	TINT	I	Tint control terminal. Can be controlled in the NTSC mode. When the pin voltage is set to 2V or less, the TV can handle a teletext signal in the 312H/313H mode. Set to more than 2V when an ordinary TV/VCR signal is received.
16	ACC FIL	—	For the connection of an ACC detection filter
17	DC FB	—	For the connection of a PAL/NTSC chroma amp DC feedback filter. The filter consists of resistors and externally attached capacitors.
18	SECAM IN	I/O	SECAM chroma signal input. Connect a bell filter. This is used in common with a 50/60 Hz discrimination output which goes "H" (7.50V) with 60 Hz and "L" (4.45V) with 50 Hz.
19	C GND	—	Ground of chroma circuits
20	P/N IN	I	PAL/NTSC chroma signal input. This is used in common with a SECAM identification select switch.
22, 23, 27	P/S/N IDENT.	—	For the connection of an identification filter. Pin 22: PAL identification Pin 23: SECAM identification Pin 27: NTSC identification
24	S REF	—	For the connection of a resonance coil for SECAM identification. Tuned to 4.328 MHz. Adjust so the DC voltage at the SECAM identification (pin 23) is maximum when a SECAM signal is received.
25	APC FIL	—	For the connection of an APC filter
26, 28	3.58/4.43 IN	I	Crystal oscillator are connected between these pins and pin 30 as color subcarrier oscillators. Connect a 3.58 MHz crystal to pin 26. Connect a 4.43 MHz crystal to pin 28.
29	V OUT	O	Vertical output termina

Pin No.	Pin Name	I/O	Description
30	VCO OUT	O	Crystal oscillator are connected between this pin and pins 26 and 28 to form color subcarrier oscillators.
31	V RAMP	—	The externally attached capacitor is charged by the voltage determined by the Zener diode during the vertical retrace period and is discharged with the time constant determined by external resistors and capacitors during the scanning period to obtain a ramp waveform.
32	V NFB	I	Vertical output AC/DC feedback terminal
33	SYNC SEPA	I	Horizontal/vertical sync separator input. Apply a 2Vp-p video signal with negative sync via a filter.
34	GP TC	—	Connect time constant components to generate a gate pulse.
35	H BLK	I	Blanking pulse input. The pulse is shaped to apply blanking to the delay line drive, color difference outputs and RGB outputs and change the PAL switch. This is also used as a sync signal output. The masked sync signal is output in a period other than the input blanking pulse period and can be used to detect whether a signal is present, etc. 
36	AFC	—	For the connection of a filter for the horizontal AFC circuit
37	H OSC	—	Forms a 32fH (503kHz) oscillator.
38	H AFC	I	Forms a horizontal AFC circuit. Apply a sawtooth signal (2Vp-p) obtained by integrating the flyback pulses.
39	H OUT	O	Horizontal output with 42% duty and 5.1Vp-p (standard).
40	H VCC	—	H.VCC=9V (standard). Power supply of horizontal deflection circuit
41-43	R/G/B OUT	O	Pin 41: R output, Pin 42: G output, Pin 43: B output
44-46	R/G/B CLAMP	—	For the connection of clamp capacitors. Pin 44: R, Pin 45: G, Pin 46: B
47, 49, 51	R/G/B TX	I	External RGB signal inputs. The signal level is 0.7Vp-p.
48	BRT	I	Brightness control terminal
50	V/D GND	—	Ground of deflection and video systems
52	X-RAY	I	Overvoltage protector circuit. The threshold is 1.3V (standard). If a voltage exceeding this is applied, the horizontal output terminal (pin 39) is set to "L".
53	TV/TX SW	I	Switch changed between the TV and external RGB signals and for blanking
